Data Hub

The acquisition of all essential data you need to evaluate your car performance needs the connection of many peripherals to your datalogger. This implies the presence of a great number of cables.

To solve this problem, AiM developed **Data Hub**, the new CAN connection multiplier that works as an interface between AIM Logger (MXL/EVO3 Pro) and its peripheral equipments.

Each Hub connects the logger with four peripherals: i.e. **LCU lambda controller**, **GPS05 Module** and one or more **TC Hub** (thermocouples multiplier).

Data Hub takes all the information you need to your logger with only one cable, minimizing wires overall.

Data Hub is available in two versions:

- **Two ways Data Hub** with external power
- **Four way Data Hub**

More **Data Hub** can be connected in sequence in order to increase the number of peripherals which can be connected. **Data Hub** is waterproof IP65.
